

Problem Sheet 8

Problems in Part A will be discussed in class. Problems in Part B come with solutions and should be tried at home.

Part A

(8.1) Consider the general convex optimization problem

$$\text{minimize } f(\mathbf{x}) \quad \text{subject to } \mathbf{f}(\mathbf{x}) \leq \mathbf{0}, \quad \mathbf{Ax} = \mathbf{b}.$$

The central path consists of the set of solutions $\mathbf{x}(t)$, $t > 0$, of the barrier problem

$$\text{minimize } tf(\mathbf{x}) + \varphi(\mathbf{x}) \quad \text{subject to } \mathbf{Ax} = \mathbf{b},$$

where $\varphi(\mathbf{x}) = -\sum_{i=1}^m \log(-f_i(\mathbf{x}))$ is the logarithmic barrier function. Show that a point \mathbf{x} is equal to a point $\mathbf{x}^*(t)$ on the central path if and only if there exist dual multipliers $\boldsymbol{\lambda}^*$ and $\boldsymbol{\mu}^*$ such that the following conditions are satisfied:

$$\begin{aligned} \mathbf{f}(\mathbf{x}^*) &\leq \mathbf{0} \\ \mathbf{Ax}^* &= \mathbf{b} \\ \boldsymbol{\lambda}^* &\geq \mathbf{0} \\ -\lambda_i^* f_i(\mathbf{x}^*) &= \frac{1}{t}, \quad 1 \leq i \leq m \\ \nabla_{\mathbf{x}} f(\mathbf{x}^*) + \sum_{i=1}^m \lambda_i^* \nabla_{\mathbf{x}} f_i(\mathbf{x}^*) + \mathbf{A}^\top \boldsymbol{\mu}^* &= \mathbf{0}, \end{aligned}$$

(8.2) Let $\{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ be a series of data points with $\mathbf{x}_i \in \mathbb{R}^p$ for $1 \leq i \leq n$, and associated labels $\{y_1, \dots, y_n\}$ with $y_i \in \{-1, 1\}$. Consider the following version of the Support Vector Machine optimization problem that allows for few mistakes:

$$\begin{aligned} \text{minimize } & \frac{1}{2} \|\mathbf{w}\|^2 + \mu \sum_{j=1}^n s_j \\ \text{subject to } & y_i(\mathbf{w}^\top \mathbf{x}_i + b) - 1 + s_i \geq 0, \quad 1 \leq i \leq n \\ & s_i \geq 0, \quad 1 \leq i \leq n, \end{aligned}$$

Formulate the Lagrange dual and the KKT conditions for this problem. Show that the Lagrange dual does only depend on the inner products $\langle \mathbf{x}_i, \mathbf{x}_j \rangle$ of the data points.

(8.3) A matrix

$$\mathbf{A} = \begin{pmatrix} \mathbf{B} & \mathbf{v} \\ \mathbf{v}^\top & b \end{pmatrix},$$

is positive definite if and only if $b - \mathbf{v}^\top \mathbf{B}^{-1} \mathbf{v} \geq 0$. Use this, and the fact that a symmetric matrix factors as $\mathbf{A} = \mathbf{M}^\top \mathbf{M}$ for some \mathbf{M} , to show that the QCQP from Problem Sheet 7 can be formulated as a semidefinite programming problem.

Part B

(8.4) Given a symmetric matrix \mathbf{A} , formulate the problem of computing the largest eigenvalue $\lambda_{\max}(\mathbf{A})$ as a semidefinite programming problem.

(8.5) In many applications one is interested in finding a matrix of low rank that satisfies certain constraints. For example, one could have a covariance matrix, or a matrix containing user ratings of products, or a matrix whose entries are the squared distances between objects, but where only some entries are known. A common heuristic is to replace the rank of a symmetric matrix with the sum of the eigenvalues

- (a) Show that for a symmetric matrix \mathbf{A} , the sum of the eigenvalues $\lambda_1 + \cdots + \lambda_n$ equals the trace $\text{tr}(\mathbf{A})$. We can therefore write

$$\lambda_1 + \cdots + \lambda_n = \text{tr}(\mathbf{A}) = \mathbf{I} \bullet \mathbf{A}.$$

- (b) Formulate the problem of minimizing the trace of a symmetric positive semidefinite matrix \mathbf{X} subject to constraints of the form

$$x_{ij} = a_{ij}$$

for some subset of indices $(i, j) \in \Omega \subseteq \{1, \dots, n\}^2$. The problem is that of finding the matrix of smallest trace with some predetermined entries. Determine the dual of this problem.

- (c) Using CVXPY in Python or CVX in MATLAB, perform the following experiment:

- Generate a random matrix $\mathbf{X}_0 \in \text{SYM}_{100}$ of rank 10.
- For an increasing subcollection of “known” entries from \mathbf{X}_0 , solve the trace minimization problem and determine if the solution of this optimization problem coincides with the matrix \mathbf{X}_0 , thus effectively recovering it from only limited information.
